

Appl. No. 10/820,850
Amdt. Dated 07/07/05
Reply to Office Action of 04/07/05

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (original) A kit for marking a predetermined position of at least one wire connected to an electronic device, said kit comprising:

at least one male plug having a substantially cylindrical body and front and rear end portions, said body having a centrally disposed longitudinal axis and including an elongated prong section extending therealong, said prong section being integral with said body and having a first end portion disposed substantially medially of said front and rear end portions and further having a second end portion spaced forwardly of said front end portion for being removably positionable into an input jack of an electronic device, said rear end portion of said body having indicia thereon unique to a select input jack; and

at least one female plug having a substantially cylindrical body and a centrally disposed longitudinal axis, said body having a groove formed therein and extending along the longitudinal axis thereof for receiving a male end portion of a wire when removed from an input jack, said body further having a visible front end portion having indicia thereon, said front end portion indicia corresponding to said rear end portion indicia so that a user can identify a select input jack for receiving a corresponding wire.

2. (original) The kit of claim 1, wherein said front and rear end portion indicia have identical numerals.

3. (original) The kit of claim 1, wherein said front and rear end portion indicia have identical colors.

Appl. No. 10/820,850

Reply to Office Action of 04/07/05

4. (original) The kit of claim 1, wherein said prong section is formed from non-conductive material.

5. (original) The kit of claim 1, wherein said prong section is formed from resilient material for being selectively adapted into a plurality of shapes as desired by a user.

6. (original) The kit of claim 1, wherein said prong section has an octagonal cross-section.

7. (original) The kit of claim 1, wherein said at least one male and female plugs are formed from non-conductive material respectively.

8. (currently amended) A kit for marking a predetermined position of at least one wire connected to an electronic device, said kit comprising:

at least one male plug having a substantially cylindrical body and front and rear end portions, said body having a centrally disposed longitudinal axis and including an elongated prong section extending therealong, said prong section being integral with said body and having a first end portion disposed substantially medially of said front and rear end portions and further having a second end portion spaced forwardly of said front end portion, said second end portion for being removably positionable into an input jack of an electronic device, said male plug being spaced from the wire and prohibiting the wire from being inserted into the input jack when said male plug is positioned into the input jack, said prong section being formed from resilient material for being selectively adapted into a plurality of shapes as desired by a user, said rear end portion of said body having indicia thereon unique to a select input jack, said male plug having a longitudinal length shorter than a longitudinal length of the wire; and

at least one female plug having a substantially cylindrical body and a centrally disposed longitudinal axis, said body having a groove formed therein and extending along the longitudinal axis thereof, the groove for receiving a male end portion of a wire

Appl. No. 10/820,850
Amdt. Dated 07/07/05
Reply to Office Action of 04/07/05

when the wire is removed from an input jack, said female plug prohibiting the wire from being positioned into the input jack when said female plug is attached to the wire, said body further having a visible front end portion having indicia thereon, said front end portion indicia corresponding to said rear end portion indicia so that a user can identify a select input jack for receiving a corresponding wire, said male plug having a longitudinal length shorter than a longitudinal length of the wire.

9. (original) The kit of claim 8, wherein said front and rear end portion indicia have identical numerals.

10. (original) The kit of claim 8, wherein said front and rear end portion indicia have identical colors.

11. (original) The kit of claim 8, wherein said prong section is formed from non-conductive material.

12. (original) The kit of claim 8, wherein said prong section has an octagonal cross-section.

13. (original) The kit of claim 8, wherein said at least one male and female plugs are formed from non-conductive material respectively.

14. (currently amended) A kit for marking a predetermined position of at least one wire connected to an electronic device, said kit comprising:

at least one male plug having a substantially cylindrical body and front and rear end portions, said body having a centrally disposed longitudinal axis and including an elongated prong section extending therealong, said prong section being integral with said body and having a first end portion disposed substantially medially of said front and rear end portions and further having a second end portion spaced forwardly of said front end portion for being removably positionable into an input jack of an electronic device,

said prong section being formed from resilient material for being selectively adapted into a plurality of shapes as desired by a user, said rear end portion of said body having indicia thereon unique to a select input jack; and

at least one female plug having a substantially cylindrical body and a centrally disposed longitudinal axis, said body having a groove formed therein and extending along the longitudinal axis thereof for receiving a male end portion of a wire when removed from an input jack, said body further having a visible front end portion having indicia thereon, said front end portion indicia corresponding to said rear end portion indicia so that a user can identify a select input jack for receiving a corresponding wire;

said at least one male and female plugs are formed from non-conductive material respectively;

wherein said prong section is formed from non-conductive material, said male and female plugs being coextensively shaped, said prong section having a tapered end portion for firmly fitting into the input jack, said male and female plugs being removably and directly engageable wherein said prong section is telescopically positional into the groove.

15. (original) The kit of claim 14, wherein said front and rear end portion indicia have identical numerals.

16. (original) The kit of claim 14, wherein said front and rear end portion indicia have identical colors.

17. (canceled)

18. (original) The kit of claim 14, wherein said prong section has an octagonal cross-section.
